                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to peptides and peptidomimetics that bind to the extracellular domain of ErbB2 (also known as HER2 or neu). Sequences of the invention are useful in the diagnosis, prevention and treatment of disorders characterised by ErbB2 overexpression (e.g. breast cancet). The invention is also useful in protein therapy. The present sequence is human c-erbB2 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A composition for diagnosing, preventing or treating disorders characterized by ErbB2 overexpression (e.g. breast cancer) comprises an ErbB2 binding peptide that binds specifically to the extracellular domain of ErbB2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ELTYLPTNASLSFLQDIQEVQGYVLIAHNQVRQVPLQRLRIVRGTQLFEDNYALAVLDNG 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention relates to a novel medical method comprising providing an implantable microscopic device including a nanostructure provided with a ligand for effectively coupling the nanostructure to a predetermined chemical or molecular site. Specifically, the microscopic device is directly implanted into patients at predetermined sites, and on reaching the tractly implanted into patients at predetermined sites, and on reaching confectly implanted into patients at predetermined sites, and on reaching contention tractly implanted into patients at predetermined sites, and on reaching contention describes using this method for the treatment of various invention describes using this method for the treatment of various disrupted by activation of the nanostructure, as well as bone injuries and cancer. Furthermore, the target can consist of a microorganism containing a strand of viral DNA, such that heating the nanostructure can describe attaining a strand of viral DNA, such that heating the nanostructure can destroy the microorganism, which in turn can be used therapeutically to treat HIV patients. This polypoptide sequence is the human erb-B protein that is over expressed in human breast tumour cells and therefore acts as

C containing a dimer of a complex of EGF with EGFR in the molar ratio 1:1.

Also described: (1) preparation of EGFR which can be crystallised, in the recombinant EGFR is prepared using lecs cells and then complex of EGFR is prepared using lecs cells and then complex of the accordance of the EGFR with EGF or with EGFR with another EGFR activity regulator (1), in which crystallisable EGFR is contacted with EGF or (1); (3) screening potential (1) by determining the fit of the 3D structure of (1) to that of the EGFR EGFR complex; (4) substances obtained by the screening method for use as agonists and antagonists of EGFR; (5) screening EGFR mitteraction site, by comparing their 10 that of EGFR complex; (6) preparation of anti-EGFR dimerisation region or in the EGFFR; (5) design of epitopes using the 3D structure of that of EGFR complex; (6) preparation of anti-EGF or anti-EGFR antibodies using the EGFR (1) antibodies using the 3D structure of the EGF-EGFR complex; (6) preparation of anti-EGF or anti-EGFR antibodies using the epitopes identified; (7) anti-EGF or anti-EGFR antibodies using the complex; (6) preparation of anti-EGF or anti-EGFR antibodies using the complex is method; and (8) polypeptides and their salts containing all or part of the amino acid sequence of the EGFR (including stomach ulcer; skin ulcer and ulcer and ulcers (including stomach ulcer; skin ulcer and ulcers (including stomach ulcer; skin ulcer and ulcer arising from diabetic complication). Parkinson's disease, bone cresorption disorders and ringworm. The present sequence represents a human ErbBE2 amino acid sequence, which is used in the experience of the effective of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Crystalline complex of epithelial growth factor with its receptor for design of ligands and antibodies to the receptor for treatment of ulcers, cancer and Parkinson's disease.
                                                                                                                                                                                                                                                                            antiparkinsonian, fungicide;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a non-naturally occurring human epidermal growth factor receptor (HER)-3 variant polypeptide comprising amino acids 19-329 or 12-329 of the 1342 amino acid HER3 polypeptide (MDB6761) or a sequence which differs from native HER3 polypeptide and having amino acid substitutions at residues E43, N44, K51, E64, V66 and V110 of S1, is new. The variant HER-3 specifically binds to the heregulin polypeptide (ADB6761), exhibits an impaired ability to interact with HER2 polypeptide (ADB67621), or has an ability to inhibit the interaction between wild-type HER3 and heregulin. The polypeptide is useful for identifying a compound which specifically binds to heregulin binding domain in a HER3 variant polypeptide. The method further involves determining whether the test compound inhibits or enhances the heregulin induced tyrosine kinase activity associated with a HER3 polypeptide. The polypeptide is also useful for determining whether a test compound modulates the interaction between a heregullin polypeptide, and the variant HER-3 polypeptide is also useful for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention relates to a novel method for the prediction, diagnosis, or prognosis of malignant neoplasia by the detection of at least two markers. The invention may also be useful for the development of cytostatic compounds through the regulation of the expression of a gene or activity of a protein associated with malignant neoplasia. The method is useful for prediction, diagnosis or prognosis of malignant neoplasia such as breast cancer, ovarian cancer, pastric cancer, colon cancer, ossophageal cancer, ovarian cancer, bladder cancer or non-small cell ung cancer. The polymucleotides and polypeptides defined in the specification, antisense polymucleotides targeting the polymucleotides, antibodies targeting either one of the polymucleotides, and compounds identified by the screening methods are useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Predicting, diagnosing or prognosing malignant neoplasia by detecting least two markers, where the markers are genes from one or more chromosomal regions altered in malignant neoplasia,.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes a polypeptide (I) comprising a component deflected from: (a) a polypeptide epitope having any of the 503 fully defined sequences of 8-33 amino acids (SEQ ID NO:108-610); (b) an epitope cluster comprising the polypeptide of (a); (c) a polypeptide having substantial similarity to (a) or (b); (d) a polypeptide having emilarity to any of (a) - (c); or (e) a mucleic acid encoding the polypeptide of (a)-(d); (I) has virucide and cytostatic activities, and can be used in vaccines. The methods and compositions of the present invention are useful for the diagnosis and/or treatment of viral infections, cancers and tumours. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                               epitope; epitope cluster; virucide; cytostatic; vaccine; viral infection;

The polypeptides and polymucleotides are useful for treating and diagnoshing immune related disorders in mammals. The immune related disorders in mammals. The immune arthritis, osteoarthritis, juvenile chronic arthritis, systemic sclerosis, Sjogren's syndrome, vasculitis, sarcoidosis, autoimmune haemolytic anaemia, autoimmune thrombocytopenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, demyelinating diseases of the central or peripheral nervous system, demyelinating diseases of the duillan-Barre syndrome and chronic inflammatory demyelinating bolymeuropathy. This sequence represents a human FRO polypeptide of the invention.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

protein-tyrosine kinase (EC 2.7.1.112) neu precursor - rat
C;Species: Rattus norvegicus (Norway rat)
C;Date: 31-Dec-1988 #sequence_revision 31-Dec-1988 #text_change 09-Jul-2004
C;Accession: A24562; A61204
R;Bargmann, C.I.; Hung, M.C.; Weinberg, R.A.
Nature 319, 226-230, 1986
A;Title: Tite neu oncogene encodes an epidermal growth factor receptor-related protein.
A;Reference number: A24562; MUID:86118662; PMID:3945311
A;Reference number: A24562; MUID:86118662; PMID:3945311

pridermal growth factor receptor precursor - chicken
NiContains: protein-tyrosine kinase (BC 2.7.1.112) erbB
C;Species: Gallus gallus (chicken)
C;Decies: Gallus gallus (chicken)
C;Date: 28.Peb-1996 #sequence_revision 05-May-1995 #text_change 09-Jul-2004
C;Accession: A27720; A00643
R;Lax, I.; Johnson, A.; Howk, R.; Sap, J.; Bellot, F.; Winkler, M.; Ullrich, A.; Vennstr Mol. Cell. Biol. B; 197720; MulD:88261272; PMID:3260329
